

For most yards, our standard dog fence Boundary is the right balance between containment and yard space, allowing your pets to get 2.5-5 feet from the wire. Every property is different, and standard boundaries can be installed in many different and adjustable ways. The SmartReceiver activation field is balanced, with equal width on each side of the wire. The correction zone can also be extended if necessary with our three adjustable Stopper™ settings if needed.

Pet Stop's patented Edge-To-Edge™ Boundary Technology delivers up to 25% more yard space allowing your pets to roam safely in their whole yard, even very close to the edge. It's a great solution for small lots or areas where walking space is limited. The vast majority of the SmartReceiver activation field is outside the wire, and that correction zone can be extended using our three adjustable Stopper™ settings for the pet that needs a little more convincing. Ask your representative how this technology might be used in your specific situation.
